

RampRep v1.2 Rescue Report

Watch buttons, direct exercise sources, USDA net-carb lookup, walk/ruck/bench support, and mobile overflow cleanup.

Generated for handoff/share with ChatGPT. USDA API key value is REDACTED and is not included in this PDF, screenshots, repo, tests, or build artifacts.

What Changed

- Replaced generic exercise source behavior with an explicit media source model: YouTube video, external video, external article, or none.
- Changed demo buttons so verified videos show Watch, verified articles show Read how-to, and unreviewed items show Demo needed without an inert clickable button.
- Removed Open Food Facts from the live net-carb lookup flow and kept USDA FoodData Central as the only external lookup source.
- Moved USDA key handling into a local-only private IndexedDB table with masked Settings controls: Save USDA key, Test USDA, Clear USDA key.
- Added hydration rucksack, walk, dog walk, ruck commute, ruck walk, portable bench, and bench-supported exercise support.
- Renamed the UI from Carbs to Net Carbs and tightened mobile layout rules to prevent horizontal clipping at 390px and 430px widths.

USDA Security Notes

- API key storage is local browser-only. Normal JSON export never includes the key, and the old Private JSON path was removed.
- Added .env.local, local.private.json, *.private.json, and *.private.* to .gitignore.
- Local key present during screenshot QA: no. A transient live USDA smoke request was attempted with the redacted key and returned HTTP 403 API_KEY_INVALID; confirm or rotate the key in FoodData Central before saving it in RampRep.
- Automated tests do not call USDA live endpoints and do not require a real key.

Exercise Media Matrix

Exercise	Default action	Source
dead bug	Watch	YouTube embed, direct video ID
downward dog	Watch	Yoga Journal YouTube embed
step-up	Watch	Mayo Clinic direct video page
one-arm dumbbell row	Watch	YouTube direct video ID
bird dog, glute bridge, front plank, side plank, goblet squat, 90/90 hip switch	Read how-to	Direct ACE/NASM/Rehab Hero exercise pages
unreviewed priority exercises	Demo needed	No generic provider root link shown

Validation

- npm test: 14 files passed, 58 tests passed.
- npm run build: TypeScript and Vite production build passed.
- npm run lint: passed.

- Playwright/Chrome mobile QA: no horizontal overflow on Today, Ride/Walk/Ruck, Net Carbs, USDA lookup, Settings, and dead bug Watch demo at 390px; Ride/Lookup/Settings also checked at 430px.
- Exact USDA key safety scan across source, public, docs/reports, dist, README/tests, and git diff: passed.

Screenshots

Today: Net Carbs wording and tiny walk-base status, 390px viewport.

Recommended Next Steps

- Confirm or rotate the USDA key because USDA returned API_KEY_INVALID, then use Settings > Net Carb Settings > Save USDA key > Test USDA.
- Continue adding verified direct exercise videos for the remaining needs-review exercises, prioritizing band work, carries, calves, tibialis, and ruck/walk safety drills.
- Consider a one-time migration for existing local databases if you want already-seeded routine exercise variation options to update without a reset.
- Add a richer ruck report chart for load trend and discomfort trend once there are a few real ruck logs.
