

RampRep Demo Media Rescue and UI Simplification

Report generated June 23, 2026 for RampRep, RAM Prep: Ride Across America Preparation.

Branch: feat/demo-media-rescue-ui-simplify

Implementation commit: 782e06e

GitHub Pages URL: <https://kevinhegg.github.io/ramprep/>

Deployment note: this report was generated after local lint, test, build, and mobile QA passed. GitHub Pages deployment is confirmed after the report commit is pushed and merged to main.

Summary

- Replaced the old card-sized exercise demo modal with a full-screen mobile-first ExerciseDemoView.
- Removed fake generated SVG/CSS drawings from primary exercise demo and library surfaces.
- Added a typed exercise demo media catalog with verified, needsReview, and attribution metadata.
- Rewrote weak priority exercise instructions, especially downward dog and 90/90 hip switch.
- Simplified the mobile UI: five-item bottom nav, More hub, library Filter sheet, less routine/card clutter, and focused Net Carbs default view.
- Added linter and structure tests for instruction quality, media catalog policy, full-screen demo CSS, edit-mode visibility, and nav count.

Before Screenshots

The old live build did not expose a visible How-to button for the searched result within the capture attempt, so the old modal screenshot was unavailable. The before captures still show the failed primary media approach: filter chip clutter and a fake SVG/CSS exercise drawing shown as demo media.

Before: library default consumed by chip/filter clutter.

Before: old downward dog card used fake SVG/CSS media and buried actions.

After Screenshots

After: library default is search plus one Filter button and simple How to / Log cards.

After: filters moved into a bottom sheet.

Downward Facing Dog - Yoga Jo

Yoga Journal

Watch on

YouTube

Mobility & Yoga

beginner

Purpose

Posterior chain, shoulder, and spine mobility reset after cycling or desk time.

Setup

Start on hands and knees. Hands slightly forward of shoulders. Spread fingers. Press knuckles and the base of each index finger into the mat. Tuck toes.

Steps

1. Exhale and lift knees from the floor.

2. Send hips up and back to make an upside-down V.

3. Keep knees bent if tight hamstrings pull the low back round.

4. Push the floor away so shoulders stay broad and away from ears.

After: downward dog opens a full-screen demo with verified YouTube embed and specific instructions.

← Back

EXERCISE DEMO

downward dog

- Snuggling shoulders into ears.
- Dumping all weight into wrists.
- Locking knees when hamstrings are tight.

Make it easier

- Bend knees more.
- Place hands on a wall or chair.
- Shorten the hold to 1-2 breaths.

Make it harder

- Hold longer with smooth breathing.
- Pedal calves slowly.
- Add slow plank-to-down-dog transitions.

Dose

3-6 slow breaths or 30-60 seconds.

Safety notes

- Stop if wrists, shoulders, or head pressure feel sharp or escalating.
- Avoid long holds if dizziness or uncontrolled high blood pressure symptoms appear.

Equipment and target areas

bodyweight, yoga mat · calves, hamstrings, shoulders

90/90 Hip Switch and More

← Back

EXERCISE DEMO

90/90 hip switch

VERIFIED EXTERNAL HOW-TO

90/90 Hip Switch

External how-to reference from Rehab Hero. RampRep links out and paraphrases its own instructions.

↗ Open source

Mobility & Yoga

beginner

Purpose

Hip internal and external rotation practice for saddle comfort and easier low-speed bike handling.

Setup

Sit tall on the floor. Bend both knees so the front shin and back shin each form roughly 90 degrees. Place fingertips lightly behind you if balance or hip mobility is limited.

Steps

1. Start with ribs stacked over hips and both sit bones heavy.

2. Press the outside edges of both feet into the floor.

3. Rotate both knees slowly toward the opposite side while keeping feet close to their starting spots.

Why Fake SVG Demos Were Removed

The generated SVG/CSS drawings were decorative and did not teach movement. They risked implying form guidance without providing body landmarks, timing, load position, or safety context. The new policy treats them as unsuitable for primary demo media. RampRep now shows verified embeds/links when available, and otherwise clearly states No verified demo yet.

Media Source Policy and Licensing Notes

- YouTube is embedded only through iframe URLs with controls and playsinline behavior. RampRep does not download, scrape, or cache YouTube media.
- External pages are linked rather than copied into the repository.
- DAREBEE, scraped MuscleWiki, copied ACE/Yoga Journal media, and unlicensed bundled assets are not used.
- wger or free-exercise-db material remains allowed only when license metadata is clear and attribution is displayed.
- Every media catalog row carries provider, source URL, reviewedBy, reviewedAtISO, qualityStatus, attribution text, and offline availability.

Verified Media

- downward dog - Yoga Journal YouTube embed, linked/embedded only
- 90/90 hip switch - Rehab Hero external how-to link
- goblet squat - NASM external how-to link
- bird dog - ACE Exercise Library external how-to link

Still Needs Review

cat-cow, child's pose with side reach, low lunge hip-flexor stretch, figure-four stretch, hamstring stretch, thoracic open book, sphinx pose, cobra pose, couch stretch, ankle rocks, kettlebell deadlift, dumbbell Romanian deadlift, step-up, split squat, reverse lunge, one-arm dumbbell row, band pull-apart, band face pull, band external rotation, push-up, dumbbell floor press, farmer carry, suitcase carry, dead bug, side plank, glute bridge, glute bridge march, Pallof press, calf raise, soleus raise, tibialis raise, wall sit, single-leg Romanian deadlift, Burley loaded trailer ride, hill repeat ride, low-cadence climb intervals

Schema and Migration Notes

- Added ExerciseDemoMedia and ExerciseSourceReference TypeScript models.
- Kept the existing Dexie local-first architecture and existing stores intact.
- Stopped seeding fake SVG exerciseMedia rows. Existing local old rows are ignored by the new demo UI.
- Seed backfill now updates sourceReferences and reviewed instructions for existing seeded exercises without clearing workout logs, carb logs, or personal defaults.

Instruction Quality Linter Results

- Banned tautologies include position yourself in the exercise position, move into a comfortable stretch, perform the exercise, repeat as needed, and bare hold the position.
- Priority exercises must have at least 3 steps, at least 3 common mistakes, and at least one source/reference.
- Downward dog and 90/90 hip switch have specific setup, visible body landmarks, common mistakes, regressions, progressions, dose, and safety notes.

Automated Test Results

Check	Result
npm run lint	Passed
npm test -- --run	Passed - 13 files, 43 tests
npm run build	Passed - CSS 23.35 kB, JS 463.40 kB

Manual Mobile QA

- Progress: 390px scroll width on 390px viewport, offenders 0.
- Demo sticky controls: header top 0, footer bottom 844 on 844px viewport, Back button 91.6 x 44.0px.

Manual Follow-Up Needed

- Curate additional reputable YouTube embeds or licensed wger/free-exercise-db media for needsReview priority exercises.
- Review exact provider pages for each needsReview item before changing qualityStatus to verified.
- Optionally persist editMode in local settings if the user wants it remembered across sessions.
